

## Symmetries

### ① Symmetries of a square

|  |  |  |  |
|--|--|--|--|
| $\begin{matrix} 2 & 1 \\ 3 & 4 \end{matrix}$                   | $\begin{matrix} 1 & 4 \\ 2 & 3 \end{matrix}$ | $\begin{matrix} 4 & 3 \\ 1 & 2 \end{matrix}$ | $\begin{matrix} 3 & 2 \\ 4 & 1 \end{matrix}$ |
| $s \curvearrowleft \begin{matrix} 1 & 2 \\ 4 & 3 \end{matrix}$ | $\begin{matrix} 4 & 1 \\ 3 & 2 \end{matrix}$ | $\begin{matrix} 3 & 4 \\ 2 & 1 \end{matrix}$ | $\begin{matrix} 2 & 3 \\ 1 & 4 \end{matrix}$ |

the group is not the collection of positions, but the operations we can perform

Notice: we can compose operations, and this composition is associative.

$D_4$

- Not commutative.
- there's a symmetry which does nothing.
- Every symmetry is invertible.

### ② Symmetries of Euclidean space

Recall: A linear transf.  $T: \mathbb{R}^n \rightarrow \mathbb{R}^n$  can be rep'd by a matrix  $A \in M_n(\mathbb{R})$ . \*using std. basis

Consider the set

$$SO(n) := \left\{ A \in M_n(\mathbb{R}) \mid \begin{array}{l} \det A = 1 \\ A^T A = I \end{array} \right\}.$$

Such matrices satisfy

$$\langle A\vec{v}, A\vec{w} \rangle = \langle \vec{v}, \vec{w} \rangle.$$

So they preserve the Euclidean geometry of  $\mathbb{R}^n$ , since  $\langle -, - \rangle$  gives angles & lengths.

- Matrix mult. gives an assoc. composition  $(AB)C = A(BC)$  (again non-comm.)
- identity matrix does nothing

- $\det A \neq 0 \Rightarrow$  each  $A \in SO(n)$  has an inverse  $A^{-1}$ .  
 Check:  $A^{-1} \in SO(n)$

### Defn of a group

A group is a pair  $(G, \circ)$  consisting of a set  $G$  and a binary operation

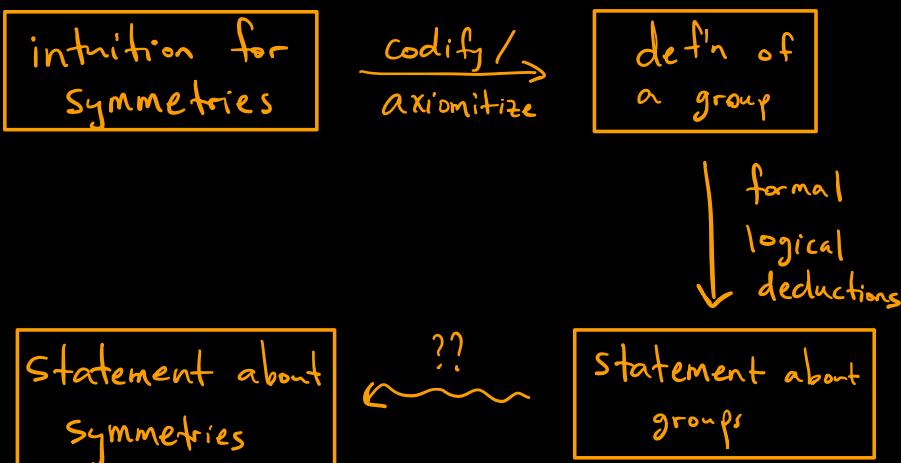

$$\circ : G \times G \rightarrow G$$

such that the following are satisfied:

- associativity:  $(a \circ b) \circ c = a \circ (b \circ c)$ ,  $\forall a, b, c \in G$ ;
- $\exists e \in G$  called the identity element, such that  
 $a \circ e = e \circ a = a$ ;
- $\forall a \in G$ ,  $\exists$  an inverse element  $a^{-1} \in G$  s.t.  
 $a \circ a^{-1} = a^{-1} \circ a = e$ .

We'll call  $(G, \circ)$  abelian or commutative if  
 $a \circ b = b \circ a$ ,  $\forall a, b \in G$ .

Otherwise, non-abelian or non-commutative.

## More examples

①  $(\mathbb{Z}, +)$ . identity: 0, inverse of  $a$ :  $-a$

$(\mathbb{Z}_n, +)$ . identity: 0, inverse of  $a$ :  $-a$

$$\mathbb{Z}_n = \{0, 1, \dots, n-1\}$$

↳ Orientation-preserving symm. of  $n$ -sided polygon

② Non-examples:  $(\mathbb{Z}, x) \nmid (\mathbb{Z}_n, x)$

missing inverses

③ From  $(\mathbb{Z}, x) \nmid (\mathbb{Z}_n, x)$  we can throw out all elements which fail to have inverses:

$(\mathbb{Z}^* = \{\pm 1\}, x)$  is a group

$(\mathbb{Z}_n^* = \{\text{invertible elements of } \mathbb{Z}_n\}, x)$   
=:  $(U(n), x)$  is a group

group of units

④  $(M_n(\mathbb{R}), +)$  is a group.  $e = \begin{pmatrix} 0 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & 0 \end{pmatrix}$ .

$(M_n(\mathbb{R}), x)$  is not a group.  $e = I_n$ .

many matrices are not invertible.

group of units = invertible elements  
 $= (GL_n(\mathbb{R}), x)$

$GL_n(\mathbb{R}) = \{A \in M_n(\mathbb{R}) \mid \det A \neq 0\}$ .

This is the symmetry group for  $\mathbb{R}^n$   
as a vector space.
